

CITRA AI

The Decision Apps platform

USE CASE · POWER UTILITY

From field photo to governed decision.

AI that reads the evidence. People who own the call.

A platform that remembers — and gets better every week.

1 day

from business requirement
to a live, governed app

100%

of writes reviewed and
approved by your people

Every

decision remembered — reasons,
corrections, real outcomes

A field inspector photographs a transformer defect and files a report.

Citra reads both, checks they agree, and recommends: repair within 7 days — with the evidence attached. Your officer reviews every item, decides, and the decision is written to your own systems. Fully audited. And remembered.

THE PROBLEM

High-volume judgment work, done by too few experts

Every utility runs on decisions like this one: an inspection comes in — photos, a report, a record — and someone experienced must decide **pass, repair, or fail**, quickly, consistently, and in a way that survives an audit. The experts who make these calls are scarce, their judgment lives in their heads, and when they leave, it leaves with them. Meanwhile the same defect photo can quietly appear on three different claims.

HOW IT WORKS

AI reads the evidence. Your people own the call.

Nothing is written without a human decision — the officer reviews **every** photo and document finding, can correct the AI's proposal in place, and must give a reason to reject (that reason teaches the platform). Weeks later, Citra checks how the decision actually turned out — and feeds that reality back into the next recommendation.

WHAT MAKES IT DIFFERENT

Four things you keep

Memory you own

Every decision is captured with its evidence, its reasoning, your officer's corrections, and the real outcome. That institutional memory belongs to you — it doesn't retire, resign, or expire with a model version. It's also, quietly, a training-grade dataset accruing for free.

Fraud caught from experience

The platform remembers every artifact it has ever reviewed. A defect photo that already served another claim is flagged the moment it reappears — with the past decision as evidence. The more you use it, the harder it is to fool.

Built in days, by your team

A business analyst described this app in one paragraph. The builder AI found the data, assembled the app, and it was live — tested and governed — the same day. Changes are a conversation, not a project.

Audit-ready by construction

Ask "why was case 4711 rejected?" and the answer is the actual evidence and precedents the decision was grounded in — not a reconstruction. Every run and every write lands in a tamper-evident ledger.

YOUR DATA, YOUR RULES

Sovereign by design

Your systems stay the source of truth

Citra never replaces your databases — it reads from them and writes decisions back to them through a single governed gateway, with your access rules enforced on every call.

Private cloud, single tenant

Each customer runs their own deployment. Your data, your memory, your learned judgment — never pooled, never shared, never used to make anyone else's product better.

Your people, identified end-to-end

Every read and write happens as the actual signed-in officer — not an anonymous service account — so accountability is real, not decorative.

No model lock-in

The knowledge lives in your own decision records and playbooks, not in model weights. When better AI models arrive, you swap them in and keep everything you've learned.

WHY THIS APPROACH WINS

Learning that starts on day one

Traditional AI projects start with months of data labelling and model training — and every correction waits for the next retrain to matter. Citra starts working from your existing procedures on day one, and learns from the very first correction your officer makes. Wrong lessons can be removed as easily as they were learned. And because every decision is captured with its *why* and its real outcome, you're always one step away from training a model of your own — without ever having depended on one.

See it on your own decisions.

Pick one real approval queue — inspections, claims, connections, refunds — and we'll stand up a governed Decision App over it, with your team, in your private cloud, in days.
